

Rationale and Tools

Jana lyengar Fastly jri@fastly.com

(with many thanks to Kazuho Oku)

What are we talking about?

The QUIC Standard

The QUIC Standard

Middleboxes

"[...] intermediary device performing functions other than the normal, standard functions of an IP router on the datagram path between a source host and destination host" - RFC 3234

Home routers (NATs) Firewalls Application load balancers (HTTP) Protocol accelerators (PEPs)

First byte of gQUIC packet was *flags*

First byte of gQUIC packet was *flags* : unencrypted, and had been 0x07 for a while

First byte of gQUIC packet was *flags* : unencrypted, and had been 0x07 for a while

We flipped a bit.

First byte of gQUIC packet was *flags* : unencrypted, and had been 0x07 for a while

We flipped a bit.

"users cannot reach any Google property over Chrome!"

What had happened

Firewall

- : allowed first packet in both directions
- : blackholed all subsequent packets

What had happened

Firewall

- : allowed first packet in both directions
- : blackholed all subsequent packets

"in wireshark, noticed that first byte was always the same"

What had happened

if udp_payload[0] == 7: QUIC

Protocol design maxim

"the ultimate defense of the end to end mode is end to end encryption"

David Clark, J. Wroclawski, K. Sollins, and R. Braden, *Tussle in Cyberspace: Defining Tomorrow's Internet*. IEEE/ACM ToN, 2005.

Current Status

Work at IETF for past 2 years

Strong focus on security and privacy

Network operator woes

Strong focus on avoiding ossification

Encryption GREASEing

Several implementation efforts

Apple (ATS), Fastly (quicly/H2O), Facebook, Firefox, F5, Google (Chromium), Microsoft, LiteSpeed, quic-go (Caddy)

QUIC Packet Format
